EGCI427: Web Programming (JS)

1. Insert javascript code into pass.html which can call the function "showInfo (u,p)" with 2 inputs: u (username) and p (password). After clicking at submit button, there will be a pop-up window as shown in figure 1.
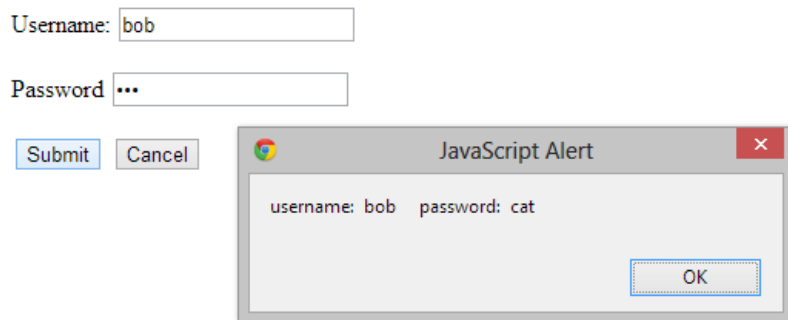

Figure 1

2. Create a javascript file named "compare.js" which contains the function comparenum(x,y) with 2 inputs x and y derived from textboxes. The comparenum(x,y) function will provide the comparison result (X>Y, X<Y, or X=Y) and calculate the difference between x and y (the different value must be positive value). After submission, the result must be illustrated as figure 2
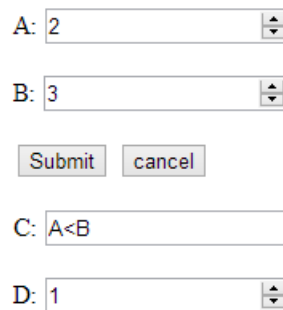

Figure 2

3. Add the function "message(adviceNumber)" in the "dynCombo.js" which can show the information from helpers array depending on the name in the combobox. The information will be changed when the name in the combobox has been changed. See in figure 3.
